## Water Walking Ball

### **Water Walking Ball**

It is developed by our company and is an improved popular water sport product in Europe and the United States. It is safe, environmentally friendly, fashionable and easy to operate. It integrates sport, enjoyment and ornament, which can exercise the coordination and balance abilities of the participator. Currently, it has set off a water sport craze in major domestic cities and will lead the new fashion of 2008 water sports.

### **I About the Material**

The balloon leather is made of import non-toxic, colorless, tasteless material, which has reached the absolute environmentally friendly standards of Europe and United States. Its thickness is 0.8MM and it is hydrolysis resistant and yellow-proof. Its pulling force and flexibility are several times higher than similar products. The zipper of the balloon is applied to military product characterized

by high pressure, waterproof, leak-proof and seals well. The above performance greatly enhances the security factor of the product and assures tourists to boldly enjoy the boundless charm of walking on the water.

**II It is for rent in parks or water playground.** It is easy to operate, environmentally friendly and fashionable. Once the player enters the balloon on the rental venue, the staff begins to pump air. When the balloon is inflated (it feels hard if hit with hands), it can be put into the water. It will not pollute the park but become attractive scenery, which can stimulate young people and children's curiosity. The state of happiness and stimulation generated by it can not be felt in other water sports.

### **III Suggestions:**

Generally, as the oxide consumption amount is about ten times higher than usual and the limited space inside the balloon can result in air circulation failure, it is better to rent for only ten minutes and let in less than three players each time.
